```
./ammc
```

Muon Propagation Code in Java v. 1.0

This computer is i386, java was found in "/usr/java/jdk1.3.1/bin"
testing java ... java version "1.3.1"
Java(TM) 2 Runtime Environment, Standard Edition (build 1.3.1-b24)
Java HotSpot(TM) Client VM (build 1.3.1-b24, mixed mode)

Usage: "./ammc [options]". Options are:

- compile" to compile the program
- compall" to compile everything
- run" to run the program
- help" for help
- amanda" to use program Amanda (default setting)
- frejus" to use program Frejus
- test" to use program Test
- p=[name]" to select some other program
- clean" clean up distribution directory
- delete" delete everything except class and data files
- manual" create javadoc manual pages
- test=1" test parametrizations of cross sections
- test=2" and of energy and tracking integrals
- hifi" generate high precision version of mmc
- float" replace doubles with floats (fl mmc)
- gcj" compile the program using gcj

```
./ammc -fl
```

Generating float (lower precision) version of mmc ...

This version of MMC has all double variables replaced with floats. It should be faster than the default version. Raw data parametrization tables of the regular version are not compatible with this mmc fl version.

```
./ammc -hf
```

Generating high fidelity version of mmc ...

This version of the program will take longer to initialize, since it computes the values for the parametrization tables with 1.e-7 precision. The tables are also somewhat larger, since more grid points are added for some integrals. The execution time after initialization should not be affected.

```
./ammc -f -h
```

Use this program for Frejus data processing in pipes

This program propagates muons of given energy through given distance
Available options are:

- vcut=[value of vcut: 0<vcut<=1]
- ecut=[value of ecut in MeV]
- medi=[medium name]
- tau propagate taus instead of muons
- time also report time of flight
- cont enable continuous loss randomization
- lpm enable lpm treatment
- allm enable allm photonuclear parametrization
- phnu=[1-4] choose another photonuclear formula
- intr=[interpolate: all, crs or ""]
- romb=[num of interpolation points]
- raw save tables in raw format
- debug print debugging information to stderr

```
./ammc -t -h
```

This program tests parametrizations used by mmc

Available options are:

- vcut=[value of vcut: 0<vcut<=1]
- ecut=[value of ecut in MeV]
- medi=[medium name]
- tau propagate taus instead of muons
- lpm enable lpm treatment
- allm enable allm parametrization
- phnu=[1-4] or choose another one
- proc=[TEST to perform: 1 or 2]
- intr=[interpolate: all, crs or ""]
- romb=[num of interpolation points]
- RND1=[first random number]
- RND2=[second random number]
- raw save tables in raw format

```
./ammc -h
```

Use this prorgam for F2000 stream processing in pipes

This program propagates atmospheric muons through the Ice to the detector
Available options are:

- length=[LENGTH of the detector volume in meters]
- radius=[RADIUS of the detector volume in meters]
- vcut=[value of vcut used for the 1st region]
- ecut=[ecut in MeV used for the 2nd region]
- medi=[medium name]
- sdec enable stopped muon decay treatment
- user enable the mmc_en user line
- user=[z] same, but record energy at z, not CPD
- time precise time of flight calculation
- cont enable continuous loss randomization
- scat enable Moliere scattering
- lpm enable lpm treatment
- allm enable allm photonuclear parametrization
- phnu=[1-4] choose another photonuclear formula
- romb=[num of interpolation points]
- raw save tables in raw format

```
zcat u-000100.f2k.gz | ./ammc -r -raw -user -sdec -time -cont -lpm -allm -scat |
